Paper 3 Advanced Practical Skills 1   **May/June 2023**

MARK SCHEME

Maximum Mark: 40

Published

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes should be read in conjunction with the question paper and the Principal Examiner Report for Teachers.

Cambridge International will not enter into discussions about these mark schemes.

Cambridge International is publishing the mark schemes for the May/June 2023 series for most Cambridge IGCSE, Cambridge International A and AS Level and Cambridge Pre-U components, and some Cambridge O Level components.

This document consists of **10** printed pages.

6	Calculation specific guidance
	Correct answers to calculations should be given full credit even if there is no working or incorrect working, **unless** the question states 'show your working'.
	For questions in which the number of significant figures required is not stated, credit should be awarded for correct answers when rounded by the examiner to the number of significant figures given in the mark scheme. This may not apply to measured values.
	For answers given in standard form (e.g. $a \times 10^n$) in which the convention of restricting the value of the coefficient (a) to a value between 1 and 10 is not followed, credit may still be awarded if the answer can be converted to the answer given in the mark scheme.
	Unless a separate mark is given for a unit, a missing or incorrect unit will normally mean that the final calculation mark is not awarded. Exceptions to this general principle will be noted in the mark scheme.
7	Guidance for chemical equations
	Multiples / fractions of coefficients used in chemical equations are acceptable unless stated otherwise in the mark scheme.
	State symbols given in an equation should be ignored unless asked for in the question or stated otherwise in the mark scheme.

Question	Answer	Marks
1(a)	Value of L in the range 40.0–50.0 cm with consistent unit.	1
1(b)	Value of T in the range 1.0–1.5 s with unit.	1
	Evidence of repeats of nT where $n \geqslant 5$.	1
1(c)	Six sets of readings of L (different values) and time with correct trend (time increases as L increases) and without help from the Supervisor scores 4 marks, five sets scores 3 marks, etc.	4
	Range: $L_{min} \leqslant 30.0$ cm **and** $L_{max} \geqslant 55.0$ cm.	1
	Column headings: Each column heading must contain a quantity and a unit where appropriate. The presentation of quantity and unit conforms to scientific convention e.g. T^3/s^3 and L^2/m^2.	1
	Consistency: All raw values of L given to the nearest millimetre.	1
	Significant figures: All values of L^2 must be given to the same number of s.f. as (or one more than) the number of significant figures in raw L.	1
	Calculation: Correct calculation of L^2.	1

Question	Answer	Marks
1(d)(i)	Axes: Axes must be labelled with the correct quantities. Scales must be chosen so that the plotted points occupy at least half the graph grid in both x and y directions. Scale markings are no more than 2 cm apart (one large square). Sensible scales must be used. Scale must not be awkward (e.g. 3:10 or fractions).	1
	Plotting of points: All observations in the table must be plotted on the grid. Diameter of plotted points must be less than half a small square. Points must be plotted to an accuracy of half a small square in both x and y directions.	1
	Quality: Trend of points must be positive. All points in the table must be plotted on the grid. It must be possible to draw a straight line that is within $\pm\,0.02$ m^2 (200 cm^2) on the L^2 axis of all plotted points.	1
1(d)(ii)	Line of best fit: 'Best fit' is judged by balance of all points on the grid (at least 5 points) about the candidate's line. There must be an even distribution of points either side of the line along the full length. Lines must not be kinked or thicker than half a small square. Some candidates may choose to identify an anomalous point. If they identify **one** point as anomalous (e.g. by circling or labelling) then this point is to be disregarded when judging the line of best fit. There must be at least 5 points left after the anomalous point is disregarded.	1

Question	Answer	Marks
1(d)(iii)	Gradient: The hypotenuse of the triangle used should be greater than half the length of the drawn line. Both read-offs must be accurate to half a small square in both x and y directions. The method of calculation must be correct, not $\Delta x / \Delta y$. The gradient sign on the answer line must be consistent with the graph drawn.	1
	y-intercept: Intercept read directly from the graph, with read-off at $L^2 = 0$, accurate to half a small square in y direction. **or** Correct read-off from a point on the line and substituted correctly into $y = mx + c$ or an equivalent expression. Read-off is accurate to half a small square in both x and y directions.	1
1(e)	Value of E = candidate's gradient **and** value of F = candidate's intercept. The values must not be written as fractions or given to only one significant figure.	1
	Units for E consistent with readings: s^3 m^{-2} or s^3 cm^{-2} **and** units for F: s^3.	1

Question	Answer	Marks
2(a)(i)	Values of *h* **and** *x* to the nearest mm.	**1**
2(a)(ii)	Correct calculation of *A* in the range 150–170 cm².	**1**
2(a)(iii)	Justification for significant figures in *A* linked to significant figures in *x* <u>and</u> *h*.	**1**
2(b)(i)	Values of *c* and *d* to the nearest mm.	**1**
	Values of *c* and *d* in the range 6.0–8.0 cm.	**1**
2(b)(ii)	Percentage uncertainty in *c* based on absolute uncertainty in the range 2–8 mm. Correct method of calculation to obtain percentage uncertainty e.g. (absolute uncertainty / value from **(b)(i)**) × 100. If several readings have been taken, then the absolute uncertainty can be half the range (but not zero) provided the working is shown clearly.	**1**
2(c)(i)	Raw value(s) of *x* to the nearest mm in the range 8.5–9.5 cm.	**1**
2(c)(ii)	Second value of *c*.	**1**
	Second value of *d*.	**1**
	Second values of *c* and *d* less than first values of *c* and *d* respectively.	**1**
2(d)	Two values of *k* calculated correctly. The final *k* values must not be written as a fraction or given to only one significant figure.	**1**
2(e)	Calculation of percentage difference between candidate's two *k* values. Comparison of percentage difference with 5% leading to a consistent conclusion.	**1**

Question	Answer	Marks
2(f)(i)	A Two readings are not enough to draw a (valid) conclusion (**not** "not enough for accurate results", "few readings"). B Difficult to draw lines with reason e.g. ruler moving/card moving/nail in the way/no support behind card/card flexible/parallax error/card suspended. C Difficult to judge vertical/get line vertical/get ruler vertical. D Lines did not meet at a point/not unique intersection/triangle of error. E Problem with card e.g. difficult to cut parallel edge/card bends or deforms or tears when nail punches. F Card doesn't hang or swing freely **or** friction <u>between card and nail</u>. *1 mark for each point up to a maximum of 4.*	4
2(f)(ii)	A Take more readings (for different values of x) <u>and</u> plot a graph **or** take more readings <u>and</u> compare k values (**not** "repeat readings" on its own). B Clamp ruler **or** mark card and then remove and draw line with card on the bench. C Use plumb-line or spirit level. D Use more holes/lines (to locate the point more accurately) **or** use thinner nail/needle/pin/smaller holes. E Use a hole punch **or** use support beneath when punching nail **or** use a guillotine/template/paper trimmer/rotary cutter /paper cutter **or** score with a (sharp) knife along (metal) ruler. *1 mark for each point up to a maximum of 4.*	4
